

Interoperability

Eliminate redundant data entry, reduce the chance for errors, and save time.

Interoperability is paramount for skilled nursing and rehabilitation facilities to exchange patient data with other EHRs or other specialty clinical software. Once systems communicate with each other, your facility can seamlessly transmit or exchange data—in real time or as frequently as required.

With 750 live interfaces in place, Wound Synergy can help get you there.

What's an Interface?

An interface is a secure connection that makes patient information available to care providers across disparate software systems within the patient's care continuum. Once systems communicate with each other, your facility can seamlessly transmit or exchange data—in real time or as frequently as required.

Wound Synergy will help ensure IMPACT Act compliance, improving reimbursements and star ratings.

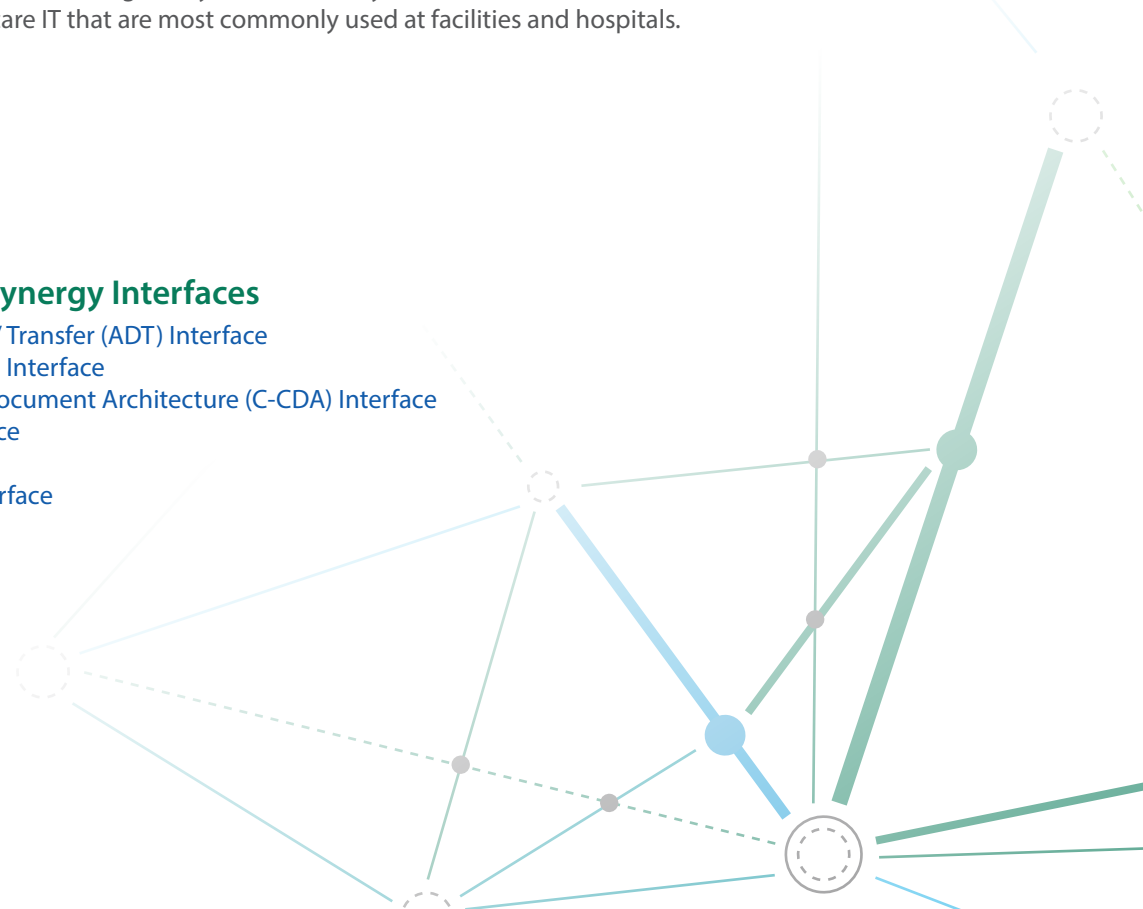

Connect to the most common names in healthcare.

Wound Synergy interfaces with a huge array of individual systems, based on client needs. This includes some of the biggest names in healthcare IT that are most commonly used at facilities and hospitals.
